

TAP - Executive Pitch One-Pager

Telolexic Audit Protocol (TAP) | Udimudi Naga Raju | July 2026

The Opportunity

Enterprises are deploying generative AI faster than they can trust it. Hallucinations cost credibility. Video continuity errors cost production time. Agent errors cost security.

TAP is the missing governance layer - a model-agnostic protocol that audits AI outputs backward from the terminal state for causal integrity.

The Problem (30 seconds)

Every major generative system runs forward: next token, next pixel, next frame. That design optimizes creation, not verification. The result:

- 15%+ of fluent LLM outputs contain logical discontinuities invisible to surface metrics
- AI video tools produce object morphing, disappearing props, and physics violations
- Autonomous agents lack explainable pre-commit audit gates

Regulation (EU AI Act), enterprise governance, and media authenticity demands are converging on auditable AI.

The Solution (30 seconds)

TAP anchors the end state and audits backward.

1. Lock terminal truth S_n
2. Traverse states in reverse
3. Flag missing precursors (continuity violation) or unexplained new elements (exigenesis)

Works across text, images, video, code, cryptography, and agents - without retraining foundation models.

What exists today

Deliverable	Status
Python LLM Supervisor (telolexia)	Working prototype
Android Visual TAP (kotlinMobile)	Working on-device demo
Crypto inverse verification	Demonstrated

Manifesto 2.0 + Whitepaper 2.0	Publication-ready
Verdict engine (TelolexicAuditor)	Production-architected

Why TAP wins

	Competitors	TAP
Approach	Bigger models, RLHF	Inverse-causal protocol
Model lock-in	Vendor-specific	Model-agnostic
Explainability	"Low confidence"	"Object X vanished - continuity violation"
Deployment	Cloud-only	Cloud + on-device (Pixel-class hardware)
Cost	Retrain / fine-tune	Governance layer on existing models

Target partners

Partner type	Integration
Google / Microsoft / Amazon	TAP safety API for cloud AI
Adobe / Runway / Disney	Viloma-Video continuity QA
Pixel / Samsung / Apple	On-device creator continuity tools
Anthropic / OpenAI	TPT post-generation audit gateway
Finance / Legal / Health	Regulated copilot governance

Business models

1. Open-core - Apache 2.0 reference + enterprise TAP Gateway (SaaS)
2. OEM license - On-device Viloma-Video SDK
3. Audit API - Per-verification metering for cloud platforms
4. IP licensing - Protocol patents + implementation support

The ask

We seek strategic partnerships for:

- Benchmark validation on enterprise datasets
- Integration into AI safety / media production pipelines
- Co-development of on-device TAP for 2026-2027 device

One line

TAP doesn't make AI bigger. It makes AI accountable.
